## v readr   1.1.1      v forcats 0.2.0

## -- Conflicts ----- tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()     masks stats::lag()

is.tibble(mtcars)
```

```
## [1] FALSE
```

So, if we can open the data.frame with tibble, then it's a tibble data.frame. If we have to open it with as_tibble(), then it is a regular data.frame. And also, we can use is.tibble() to find out if it is a tibble or just a normal data.frame.

10.5.2

```
## [1] a
## Levels: a

## [1] a
## Levels: a

##   abc xyz
## 1    1   a
```

if we want to subset some data from regular data.frame, we have to consider about the rows and columns. However, if we use tibble, we could just consider the columns. ##10.5.3

```
var <- "mpg" var[["mpg"]] var %>% .$mpg var %>% .[["mpg"]]
```

10.5.4

```
## # A tibble: 10 x 2
##       `1`   `2`
##   <int> <dbl>
## 1     1  3.01
## 2     2  2.82
## 3     3  5.01
## 4     4  8.99
## 5     5  8.75
## 6     6 11.9
## 7     7 14.7
```

```
## 8      8 14.8
## 9      9 19.4
## 10     10 20.8
```

10.5.4.1

```
## [1] 1 2 3 4 5 6 7 8 9 10
```

10.5.4.2

10.5.4.3

```
## # A tibble: 10 x 3

## 8     8    14.8   1.85
## 9     9    19.4   2.15
## 10    10    20.8   2.08
```

10.5.5

`enframe()` converts named atomic vectors or lists to two-column data frames. For unnamed vectors, the natural sequence is used as name column.

10.5.6

```
print.tbl_df
```

12.6.1

```

```

we use `na.rm = T` in this case is reasonable, because there are lots of NA values in the data which is useless. we can use `count(cases=NA)` find out the all these missing values.

```
count(who, cases = NA)
```

```
## # A tibble: 1 x 2
##   cases      n
##   <lgl> <int>
## 1 NA      7240
```

12.6.2

The code will not be separated properly into the three columns new, var, and sexage.

12.6.3

```
## # A tibble: 0 x 3
## # Groups:   country [0]
## # ... with 3 variables: country <chr>, iso2 <chr>, iso3 <chr>
```

12.6.4
